

NOTICE: CURLIN 1.2 Micron Filter Update

Dear valued customer,

This notice is to inform you that a new 1.2 micron filter will soon replace the existing 1.2 micron filter on filtered CURLIN administration sets. This new filter will be sourced from our current filter supplier, Filtertek. Switching to this new filter will allow Moog to order higher quantities of filters, and thus increase production output for 1.2 micron filtered sets.

The function of this new filter does not change in any way from the current 1.2 micron filter found on filtered CURLIN administration sets. There are no changes from current practices that are required to prepare the administration set and provide the infusion.

The only difference with this new filter is its physical geometry. See images below for comparison.

The following CURLIN administration sets will feature the new 1.2 micron filter:

- 340-4128
- 340-4128-V
- 340-4173

The new filter will be introduced in a phased approach. We anticipate that some customers will start seeing this new filter on their CURLIN 1.2 micron filtered administration sets beginning mid-March 2022.

If you have questions regarding this new filter, please contact your local CURLIN Territory Manager or Moog customer service at 800-970-2337.

Sincerely,

Alex Merrill

Product Manager, Infusion
